Franz Marc

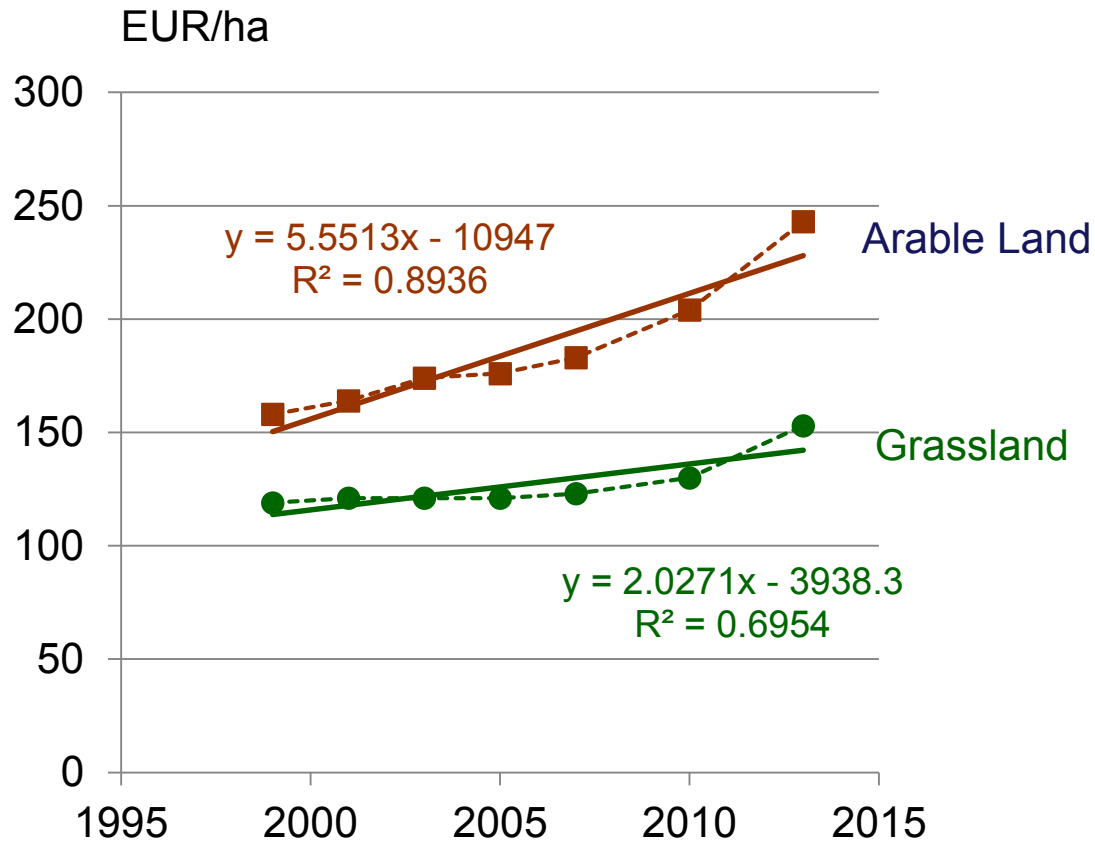

Grazing of dairy cows in the Netherlands; Data as percent of all dairy cows (Schukking & Van den Berg 2015)

kg/day

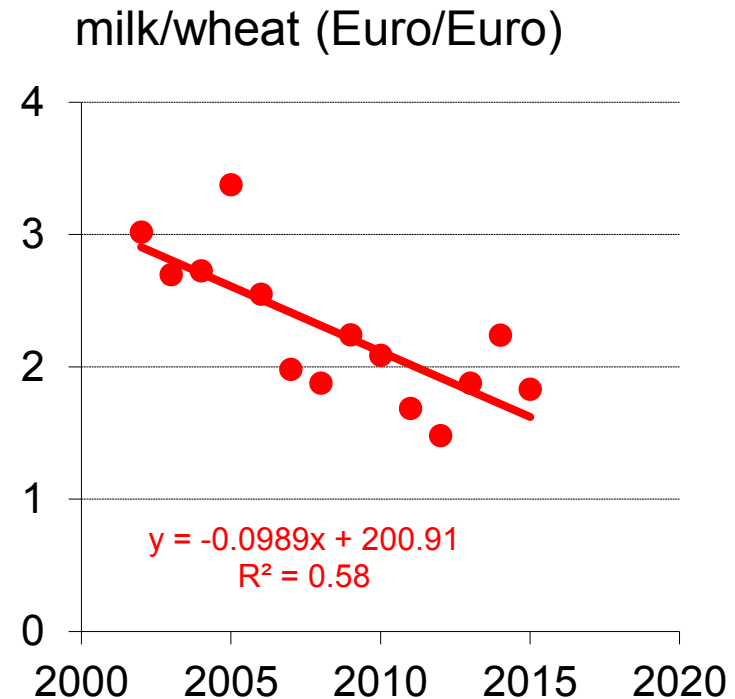

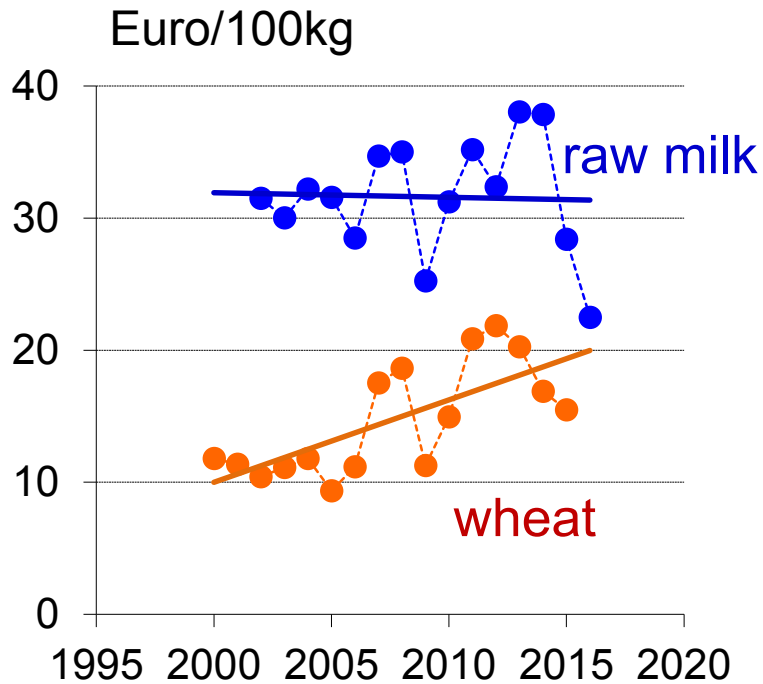

Development of the feed rations for dairy cows during the summer of the 20% best performing dairy farms in Vlanders/Belgium

(van den Pol-van Dasselaar et al. 2015)

**Development of land prices for arable and grassland in Germany
(destatis 2016)**

Entwicklung der Erzeugerpreise für Rohmilch und Weizen in Deutschland und Verhältnis von Milcherlös zu Weizenpreis (eurostat 2016)

Sources of energy supply of dairy cows in Germany, based on different estimation procedures in Germany

Forage	Estimation method	
	potential	residual
Grass	43 %	30 %
Maize	28 %	34 %
Concentrates	29 %	36 %

Ortgies 2017, unpublished

Estimation method

- potential: from official census data
- residual: back calculation from energy requirements and concentrate feeding

SAM – Structure of a collaborative endeavor

A fully transdisciplinary Approach

- **Science (multi-disciplinary)**
- **Extension/Administration**
- **Farming**

Research Areas

- **Animal welfare, animal health**
- **Udder diseases**
- **Dairy nutrition**
- **Pasture parasites**
- **Forage production/Nutrient management**
- **Resource efficiency (LCA)**
- **Farm economy**
- **Consumer behaviour/marketing**

Research areas

1 2 3.....

grazing

Groups of Farms

6-10h

>10h

Science/Extension

Selected findings: grazing (in short)

Animal health: **mainly beneficial**

Udder diseases: **general management more important**

Dairy nutrition: **awareness of transition indoor/pasture**

Pasture parasites: **less than expected**

Forage production: **potential of underutilized grasses**

Resource efficiency: **depends**

Consumers: **potential for marketing of pasture milk**

Economy: **depends**

GEORG-AUGUST-UNIVERSITÄT
GÖTTINGEN

Apart from findings....

Results are limited to variability among farms

Preparedness of farmers variable

Transformative science is not easy.....
